
2017 OPTIONS FOR INDIVIDUAL MEASURES:
REGISTRY ONLY

MEASURE TYPE:
Process

DESCRIPTION:
Image confirmation of lesion(s) targeted for image guided excisional biopsy or image guided partial mastectomy in patients with non-palpable, image-detected breast lesion(s). Lesions may include: microlcifications, mammographic or sonographic mass or architectural distortion, focal suspicious abnormalities on magnetic resonance imaging (MRI) or other breast imaging amenable to localization such as positron emission tomography (PET) mammography, or a biopsy marker demarcating site of confirmed pathology as established by previous core biopsy.

INSTRUCTIONS:
This measure is to be reported each time an image guided excisional biopsy or wire localized partial mastectomy is performed in patients with non-palpable, image-detected breast lesions. This measure may be reported by eligible clinicians who perform the quality actions described in the measure based on the services provided and the measure-specific denominator coding.

Measure Reporting:
The listed denominator criteria is used to identify the intended patient population. The numerator options included in this specification are used to submit the quality actions allowed by the measure. The quality-data codes listed do not need to be submitted for registry-based submissions; however, these codes may be submitted for those registries that utilize claims data.

DENOMINATOR:
Number of patients aged 18 years and older on date of encounter with non-palpable, image-detected (by mammogram, ultrasound, or breast MRI, PET mammography or other imaging modality) breast lesion requiring localization of lesion (benign or malignant) for targeted resection (either excisional biopsy or partial mastectomy)

Denominator Criteria (Eligible Cases):
Patients aged ≥ 18 years on date on encounter

AND
Patient encounter during the performance period (CPT): 19125, 19301, 19302
AND NOT
DENOMINATOR EXCLUSION:
Patients with needle localization specimens which are not amenable to intraoperative imaging such as MRI needle wire localization, or targets which are tentatively identified on mammogram or ultrasound which do not contain a biopsy marker but which can be verified on intraoperative inspection or
pathology (e.g., needle biopsy site where the biopsy marker is remote from the actual biopsy site):

G8873

NUMERATOR:
Patients undergoing excisional biopsy or partial mastectomy of a non-palpable lesion whose excised breast tissue was evaluated by imaging (x-ray, ultrasound, MRI, PET mammography or other imaging modality) intraoperatively to confirm successful inclusion of targeted lesion

Numerator Options:
Performance Met: Excised tissue evaluated by imaging intraoperatively to confirm successful inclusion of targeted lesion (G8872)

OR

Performance Not Met: Excised tissue not evaluated by imaging intraoperatively to confirm successful inclusion of targeted lesion, reason not given (G8874)

RATIONALE:
Many benign breast lesions and breast cancers are image-detected and will involve some form of image localization. Specimen radiography or specimen ultrasonography should routinely be performed for all excisions of image-detected abnormalities to document success of the procedure in excising the target.

CLINICAL RECOMMENDATION STATEMENTS:
Specimen radiography or specimen ultrasonography should be routinely performed for all excisions of image-detected abnormalities to help document the success of the procedure in finding the target. Specimen radiography should use two 90-degree orthogonal views. (The American Society of Breast Surgeons, 2001)
